

DEPRESSION & ANXIETY DATA COLLECTION **REFERENCE GUIDE**

Version 4.o.o Revised: January 24th, 2022

We are thrilled that you are interested in measuring outcomes for your depression and anxiety patients. It is our hope that this Reference Guide will facilitate the process of implementing this Set of Patient-Centered Outcome Measures and ensure collection of comparable data for global benchmarking and learning.

© 2022 ICHOM. All rights reserved. When using this set of outcomes, or quoting therefrom, in any way, we solely require that you always make a reference to ICHOM as the source so that this organization can continue its work to define more Sets of Patient-Centered Outcome Measures.

Introducing ICHOM and the Reference Guide

ICHOM brings together patient representatives, clinician leaders, and registry leaders from all over the world to develop Sets of Patient-Centered Outcome Measures, which are comprehensive yet parsimonious Sets of outcomes and case-mix variables we recommend all providers to track.

Each Set focuses on patient-centered results and provides an internationally agreed upon method for measuring each of these outcomes. We do this because we believe that standardized outcomes measurement will open up new possibilities to compare performance globally, allow clinicians to learn from each other, and rapidly improve the care we provide our patients.

Our Sets include initial conditions and risk factors to enable meaningful case-mix adjustment globally, ensuring that comparisons of outcomes will take into account the differences in patient populations across not just providers, but also countries and regions. A comprehensive data dictionary, as well as scoring guides for patient-reported outcomes, is included in the appendix.

Our aim is to make these Sets freely accessible to healthcare institutions worldwide to begin measuring, and ultimately benchmark the outcomes they achieve. In order to have a guide from which we can benchmark outcomes, we require feedback from initial implementation efforts. As such, this Reference Guide may undergo revisions on a regular basis. If you have any suggestions or would like to provide feedback, please contact info@ichom.org

Working Group Members for Depression & Anxiety

The following individuals dedicated both time and expertise to develop the ICHOM Set for Depression & Anxiety in partnership with ICHOM, under the leadership of Dr. Matthias Rose, Professor of Psychosomatic Medicine at the Charité University in Berlin.

Australia Maria Kangas

Brazil Roberta Alvarenga Reis

Canada Anne Crocker Lucie Langford Alain Lesage **Chile** Graciela Rojas

Germany Sandra Nolte Alexander Obbarius Matthias Rose

India Vikram Patel **Japan** Toshi A. Furkawa

Netherlands Edwin de Beurs Paul Emmelkamp

Sweden Erik Hedman

Uganda Doris M. Mwesigire **United Kingdom** David M. Clark Dave Smithson

United States Lee Baer Kelly Woolaway-Bickel Paul A. Pilkonis Harold A. Pincus Cathy Sherbourne

Supporting Organizations

The Depression & Anxiety Set is made possible only through the support of the following organizations.

Douglas INSTITUT UNIVERSITAIRE EN SANTÉ MENTALE MENTAL HEALTH UNIVERSITY INSTITUTE CHIARITÉ UNIVERSITÄTSMEDIZIN BERLIN

Thank you.

Conditions and Treatment Approaches Covered for Depression & Anxiety

For Depression & Anxiety, the following conditions and treatment approaches (or interventions) are covered by our Set.

Conditions	Depression: Major Depressive Disorder Dysthymia Depressive Adaptive/Adjustment Disorder Depressive Disorder - NOS Anxiety: Generalized Anxiety Disorder Phobic Disorder Agoraphobia Post-Traumatic Stress Disorder Panic Disorder Obsessive-Compulsive Disorder
Treatment	Psychopharmacotherapy Psychotherapy
approaches	Lifestyle Interventions Self-Guided Help Other Forms of Therapy

ICHOM Set of Patient-Centered Outcome Measures for Depression & Anxiety

Case-Mix Variables

Patient Population	Measure	Timing	Data Source	
Demographic Factors				
	Year of Birth		Clinical	
	Sex	Baseline	Cliffical	
	Educational level			
All patients	Living arrangements		Patient-reported	
	Work status	Baseline; Annually	l'attent-reported	
	Social support/Network	ocial support/Network		
Health Status				
	Patient's outcome expectancy	Baseline		
	Comorbidities	Baseline; Annually	Detient was arts d	
All patients	Duration of symptoms	Deceline	Patient-reported	
	Prior episodes of depression	Baseline		
Prior Treatment				
	Prior treatment	Baseline; Annually		
All patients	Adherence of medication	Baseline; Ongoing; Patient-reported Annually		

Treatment Variables

Patient Population	Measure	Timing	Data Source
All patients	Ongoing treatment	Ongoing	Patient-reported

Outcomes

Patient Population	ient Population Measure		Data Source	
Symptom Burden				
All patients	Symptoms of depression	Baseline; Ongoing;	Patient-Reported	
	Symptoms of general anxiety	Annually	Fatient-Reported	
Functioning				
	Physical functioning			
All patients	Work functioning	Baseline; Annually		
	Social functioning		Datiant reported	
	Time to recovery		Patient-reported	
All patients	Overall success of treatment	Annually		
	Recurrence of depression			
Other				
All patients	Medication side-effects	Baseline; Ongoing; Annually	Patient-reported	

Optional variables for patients with specific anxiety disorders

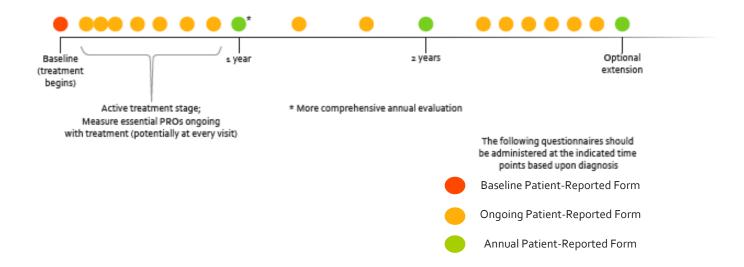

Note: Clinics may wish to compliment the Set of Patient-Centered Outcome Measures with additional questionnaires for those patients with specific anxiety disorders. We include here a list of examples as employed successfully in the Improving Access to Psychological Therapy (IAPT) program in the UK.

Symptom Burd	en		
Patients with social phobia	Symptoms of social phobia	Tracked via SPIN	
Patient with agoraphobia	Symptoms of agoraphobia	Tracked via MIA	
Patients with PTSD	Symptoms of post-traumatic stress disorder	Tracked via IESR	Baseline; Ongoing; Annually Patient-reported
Patients with panic disorder	Symptoms of panic disorder	Tracked vis PDSS-SR	
Patients with OCD	Symptoms of obsessive- compulsive disorder	Tracked via OCI-R	

PHQ--9: Patient Health Questionnaire--9; GAD--7: Generalized Anxiety Disorder--7; SPIN: Social Phobia Inventory; MI: Mobility Inventory for Agoraphobia; IES--R: Impact of Event Scale – Revised for Post--traumatic Stress Disorder; PDSS--SR: Panic Disorder Severity Scale; OCI--R: Obsessive--Compulsive Inventory; WHODAS 2.0: World Health Organization Disability Assessment Schedule 2.0

Follow-Up Timeline

The following timeline illustrates when the Set variables should be collected from patients. Links to the sample questionnaires may be found in the legend below.

The Growing ICHOM Community

There is a growing community of healthcare providers implementing the Set. To support your organization in implementing the set and the measurement of outcomes data, we have outlined a framework to guide the implementation and reporting of patient-centered outcomes. All materials can be downloaded for free from ICHOM Connect, for further information or to enquire about implementation support offered by ICHOM Partners, please contact us: info@ichom.org.

Implementation framework:

The framework below, outlines the structured process to guide the implementation of an ICHOM Set at your organization. Typically, an implementation project takes 9 months to complete.

Implementation Study:

We are keen to find out if you have implemented or are implementing our Set. Please fill in this survey: <u>bit.ly/InitialImp</u> or contact <u>info@ichom.org</u> for more information.

Translating the Set Tools:

PROMs within the ICHOM Sets are available in a number of languages. To check the availability of translations, we advise contacting the Tool authors directly to obtain and translate the PROM surveys into your desired language. To independently translate PROM surveys, if permitted by its license, we recommend following the 10 steps outlined below:*¹

Step 1	Preparation	Initial work carried out before the translation work begins
Step 2	Forward Translation	Translation of the original language, also called source, version of the instrument into another language, often called the target language
Step 3	Reconciliation	Comparing and merging more than one forward translation into a single forward translation
Step 4	Back Translation	Translation of the new language version back into the original language
Step 5	Back Translation Review	Comparison of the back-translated versions of the instrument with the original to highlight and investigate discrepancies between the original and the reconciled translation, which is then revised in the process of resolving the issues
Step 6	Harmonization	Comparison of back translations of multiple language versions with each other and the original instrument to highlight discrepancies between the original and its derivative translations, as well as to achieve a consistent approach to translation problems
Step 7	Cognitive Debriefing	Testing the instrument on a small group of relevant patients or lay people in order to test alternative wording and to check understandability, interpretation, and cultural relevance of the translation
Step 8	Review of Cognitive Debriefing Results and Finalization	Comparison of the patients' or lay persons' interpretation of the translation with the original version to highlight and amend discrepancies
Step 9	Proofreading	Final review of the translation to highlight and correct any typographic, grammatical or other errors
Step 10	Final Report	Report written at the end of the process documenting the development of each translation

*These ten steps follow the ISPOR Principles of Good Practice: The Cross-Cultural Adaptation Process for Patient-Reported Outcome Measures ¹ Wild, D., Grove, A., Martin, M., Eremenco, S., McElroy, S., Verjee-Lorenz, A., et al. (2005). Principles of good practice for the translation and cultural adaptation process for patient-reported outcomes (PRO) measures: Report of the ISPOR task force for translation and cultural adaptation. Value in Health, 8(2), 94–104. doi:10.1111/j.1524-4733.2005.04054.x.

Appendix

Scoring Instructions for the Patient Health Questionnaire (PHQ-9)

Scoring: 0-3 Scale for each item; o Not at all; 3 Nearly every day

The nine item version of the Patient Health Questionnaire (PHQ-9) was designed to facilitate the recognition and diagnosis of depression in primary care patients. It can be used to monitor change in symptoms over time and provides a depression severity index score as follows:

0-4None5-9Mild10-14Moderate15-19Moderately Severe20-27Severe

The recommended cut-off for the PHQ-9 severity index is a score of 9. Anyone who scores 10 or above can be considered to be suffering from clinically significant symptoms of depression. This is referred to as meeting "caseness".

Scoring Instructions for the Generalized Anxiety Disorder (GAD-7)

Scoring: 0-3 Scale for each item; o Not at all; 3 Nearly every day

Though designed primarily as a screening and severity measure for generalized anxiety disorder, the GAD7 also has moderately good operating characteristics for three other common anxiety disorders – panic disorder, social anxiety disorder, and post-traumatic stress disorder. The index scores are as follows:

0-4	None
5–10	Mild Anxiety
11-15	Moderate Anxiety
15 – 21	Severe Anxiety

The recommended cut off for the GAD-7 severity index is a score of 7. Anyone who scores 8 or above can be considered to be suffering from clinically significant anxiety symptoms.

In order to facilitate comparison of the PHQ-9 and the GAD-7 scores with those from the PROMIS and other similar surveys, we have provided score conversion tables on the following page.

Conversion Table for the Patient Health Questionnaire (PHQ-9)

	PROMIS Depression T		PROMIS Depression T		
PHQ-9 Score	Score	SE	PHQ-9 Score	Score	SE
0	37.4	6.4	14	64.7	3.2
1	42.7	5.3	15	65.8	3.2

9	60.9	3.2	20	77.2	3.7
10	62.3	3.2	21	80.1	4.1

Scoring Instructions for the Social Phobia Inventory (SPIN)

The Social Phobia Inventory (SPIN) has 17 items and a cut-off score of 19 or above. It is recommended where the provisional diagnosis is Social Phobia.

Scoring: 0-4 Scale for each item; o Not at all; 4 Extremely

For each item, patients select a number to indicate how bothered they have been by the item during the past week. The total score provides a measure of the severity of social phobia.

Scoring Instructions for the Mobility Inventory for Agoraphobia (MI)

The Mobility Inventory for Agoraphobia (MI) has 27 items. It is recommended where the provisional diagnosis is Agoraphobia.

Scoring: 1-5 item scale: 1 Never avoid, 2 Rarely avoid, 3 Avoid about half the time, 4 Avoid most of the time, 5 Always avoid.

Patients select numbers to indicate the degree to which they would avoid particular places or situations because of discomfort or anxiety. The total score provides a measure of the severity of agoraphobia. Each situation is rated twice to reflect the degree that the situation is avoided by the agoraphobic participant when he or she is alone, and when he or she is accompanied. Participants may skip items that are irrelevant to their lifestyles; however, Chambless et al. (1985) recommend that the scale be considered invalid for individuals who skip more than five items (20%). The MI is scored by calculating the average avoidance rating across all situations for the 'When alone' and 'When accompanied' scales. For the measure related to 'When alone' a cut-off score above an item average of 2.3 should be applied.

Scoring Instructions for the Impact of Events Scale - Revised for Post-traumatic Stress Disorder (IES-R)

The Impact of Events Scale Revised (IES-R) has 22 items and a cut-off score of 33 or above. It is recommended where the provisional diagnosis is Post Traumatic Stress Disorder (PTSD).

Scoring: 0-4 Scale for each item; o Not at all; 4 Extremely

Patients select numbers from o (not at all) to 4 (extremely) to indicate how frequently particular comments have been true during the past seven days. The total score, which ranges from o to 88, provides a measure of the severity of PTSD. When some items are missing, clinicians should calculate the mean of the items that have been endorsed and then multiply it by 22 to arrive at the total score (pro-rating).

As well as providing a total score, the IES-R also contains sub-scales for avoidance, intrusions and hyperarousal. The item numbers for each sub-scale are as follows:

Avoidance Subscale: Items 5, 7, 8, 11, 12, 13, 17, 22.

Intrusions Subscale: Items 1, 2, 3, 6, 9, 14, 16, 20.

Hyperarousal Subscale: Items 4, 10, 15, 18, 19, 21.

The total score is part of the IAPT minimum dataset and is included in the IAPT Data Standard however the sub-scales are not included. Some clinicians may find the sub-scales useful for identifying particular clinical targets and for tracking patterns of change. As the sub-scales vary in the total number of items, it is recommended that individuals who wish to use them in this way should use the mean of non-missing items when calculating sub-scale scores.

Scoring Instructions for the Panic Disorder Severity Scale (PDSS-SR)

The Panic Disorder Severity Scale (PDSS-SR) has 7 items and a cut-off score of 8.

Scoring: 0-4 Scale for each item; Response unique to each question

The PDSS is a simple, reliable instrument for use in Panic Disorder studies. A cut-score of 8 may be useful as a tool to screen patients in settings such as primary care, for diagnosis-level symptoms (Shear, M. K., P. Rucci, et al. (2001)).

	Normal	Borderline	Slightly III	Moderately III	Markedly III
Without agoraphobia	0-1	2-5	6-9	10-13	> or = 14
With agoraphobia	0-2	3-7	8-10	11-15	> or = 16

Scoring Instructions for the Obsessive-Compulsive Inventory (OCI-R)

The Obsessive Compulsive Inventory (OCI-R) has 42 Items and a cut-off score of 40 and above. It is recommended where the provisional diagnosis is Obsessive Compulsive Disorder.

Scoring: o-4 Item Scale; o=Not at all; 4=Extremely

This measure provides an obsessive compulsive disorder severity score from ratings of the extent to which particular experiences have distressed or bothered the patient in the last month.

Scoring Instructions for the World Health Organization Disability Assessment Schedule 2.0 (WHODAS 2.0)

Scoring: 0-4 Item Scale; o=None; 4=Extreme or cannot do

The scores assigned to each of the items – "none" (0), "mild" (1) "moderate" (2), "severe" (3) and "extreme" (4) – are summed. This summed score is divided by 48 and multiplied by 100 in order to give a final percentage. Functioning level ranges from 0% (full function) to 100% (no function).

Scoring Templates may be downloaded here: http://www.who.int/classifications/icf/whodasii/en/

Introduction to the Data Dictionary

This data dictionary is designed to help you measure the ICHOM Depression & Anxiety Set as consistently as possible to the Working Group recommendation. ICHOM is actively preparing for benchmarking efforts based on this data, and all data submitted for comparisons will need to be transformed into the following data structure if not already structured as such. For technical use an Excel version of this data dictionary is also available for download on ICHOM Connect. Excel data dictionary is the most up-to-date version and it is the recommended document to plan data collection.

Please timestamp all variables. Some Set variables are collected at multiple timepoints, and we will ask you to submit these variables in a concatenated VARIABLEID_TIMESTAMP form for future analyses. For example, VARIABLEID_BASE (baseline); VARIABLEID_6MO (6-month follow-up); VARIABLEID_1YR (1-year follow-up), etc.

Variable ID:	N/A
Variable:	Patient ID
Definition:	Indicate the patient's medical record number
Supporting Definition:	This number will not be shared with ICHOM. In the case patient-level data is
	submitted to ICHOM for benchmarking or research purposes, a separate ICHOM
	Patient Identifier will be created and cross-linking between the ICHOM Patient
	Identifier and the medical record number will only be known at the treating
	institution
Displayed Value:	None
Inclusion Criteria:	All patients
Timing:	On all forms
Data Source:	Clinical
Туре:	Numerical
Value Domain:	None
Response Options:	According to institution

Sex	
Sex	
The patient's sex at birth	

Supporting Definition:	For statistical purposes, the following category codes, labels and definitions are preferred:
	CODE 1 Male: Persons who have male or predominantly masculine biological
	characteristics, or male sex assigned at birth.
	CODE 2 Female: Persons who have female or predominantly feminine biological
	characteristics, or female sex assigned at birth.
	CODE 3 Other: Persons who have mixed or non-binary biological characteristics (if
	known), or a non-binary sex assigned at birth
	The value meaning of 'Other' has been assigned to Code 3 for this value domain,
	which replaces 'Intersex or indeterminate' for the superseded value domain Sex
	code N. Terms such as 'indeterminate,' 'intersex', 'non-binary', and 'unspecified' are
	variously used to describe the 'Other' category of sex. The label 'Other' is used
	because a more descriptive term has not been widely agreed within the general community.
	Sex refers to the chromosomal, gonadal and anatomical characteristics associated
	with biological sex. Where there is an inconsistency between anatomical and
	chromosomal characteristics, sex is based on anatomical characteristics.

Variable:	Question 3a of MI
Definition:	PANIC ATTACKS
Demition.	
	3: We define a panic attack as a high level of anxiety accompanied by strong body
	reactions (heart palpitations, sweating, muscle tremors, dizziness, nausea) with
	the temporary loss of the ability to plan, think, or reason and the intense desire to
	escape or flee the situation (Note: this is different from high anxiety or fear alone).
	Please indicate the number of panic attacks you have had in the past 7 days.
Supporting Definition:	None
Displayed Value:	PANIC ATTACKS

Definition:	Several of the following questions refer to panic attacks and limited symptom attacks. For this questionnaire we define a panic attack as a sudden rush of fear or discomfort accompanied by at least 4 of the symptoms listed below. In order to qualify as a sudden rush, the symptoms must peak within 10 minutes. Episodes like panic attacks but having fewer than 4 of the listed symptoms are called limited symptom attacks. Here are the symptoms to count: Rapid or pounding heartbeat, sweating, trembling or shaking, breathlessness, feeling of choking, chest pain or discomfort, nausea, dizziness or faintness, feelings of unreality, numbness or tingling, chills or hot flushes, fear of losing control or going crazy, and fear of dying.
Supporting Definition.	1: How many panic and limited symptoms attacks did you have during the week? None
Supporting Definition: Displayed Value:
